research_project	research_project_code	Grant code (Zuyd)	Notes	dynamic_88dc594d85dacd7f5b97cf9c	Actions
None	R-0001	NaN	Please use this research project if the project is not part of any research project.	nan	Edit
iDBPS	R-0002	Z15278	In collaboration with the Wilhelmina Kinderziekenhuis and Rotterdam University of Applied Sciences. Funded through RAAK. The aim of this project is to help and monitor pediatric patients with Juvenile Dermatomyositis (JDM) at home using an application that, supported by AI techniques, can conduct regular clinical tests. The development of this tool will enable personalized treatment/guidance of measuring the body remotely. This makes accurate monitoring by a medical specialist possible, without the need to visit the hospital frequently. Small changes in symptoms can be quickly monitored with the digital muscle function examination, leading to more personalized and tailored care.	nan	Edit
CHILL	R-0003	NaN	In collaboration with Nickel van den Mortel. CHILL's objective is to improve the sustainability of products and the circularity of waste. For this purpose, CHILL wants to develop a system that can automatically perform a pre-selection by type of plastic. This ensures that the batch of waste contains a higher percentage of the same type of plastic, making waste processing more efficient and better. To do this, a number of steps are required. One of these is of course reliably recognizing the type of plastic of an object on the conveyor belt. This is probably not possible with vision alone (camera image). Other sensors are better suited for this, such as a near-infrared sensor. However, these sensors cannot properly determine the current position of the object. It is therefore necessary to combine these two modules in one system.	nan	Edit
